N verify (what is YN ?) Infobox references Chemical compound 1,2-Butanediol is the organic compound with the formula HOCH2(HO)CHCH2CH3. It is classified as a vic-diol (glycol). It is chiral, although typically it is encountered as the racemic mixture. It is a colorless liquid. Preparation This diol was first described by Charles-Adolphe Wurtz in 1859.[4] It is produced industrially by hydration of 1,2-epoxybutane.[5][6] This process requires a ten- to twenty-fold excess of water to suppress the formation of polyethers. Depending on the amount of excess water, the selectivity varies from 70 to 92%.[7] Sulfuric acid or strongly acidic ion exchange resins may be used as catalysts, which allows the reaction to occur under 160 °C and at slightly above atmospheric pressure. 1,2-Butanediol is a byproduct of the production of 1,4-butanediol from butadiene.[8] It is also a byproduct of the catalytic hydrocracking of starches and sugars such as sorbitol to ethylene glycol and propylene glycol.[9] It can also be obtained from the dihydroxylation of but-1-ene by OsO4. Applications It has been patented for the production of polyester resins and plasticizers.[6][8] It is a potential feedstock for the industrial production of α-ketobutyric acid, a precursor to some amino acids.[10] Safety The LD50 (rats, oral) is 16g/kg.[5] Notes ^ The value of −50 °C for the melting point is taken from Ullmann's Encyclopedia of Industrial Chemistry and used by the Hazardous Substances Data Bank and the OECD Screening Information Dataset. Other reported values of the melting point range from −114 °C to −30 °C. References ^ Weast, Robert C., ed. (1981). *CRC Handbook of Chemistry and Physics* (62nd ed.).
